13. ABSTRACT (Maximum 200 words) <p>The purpose of this study was to examine all 1999 active duty (AD) use of the Army's ambulatory treatment facilities, characterize various levels of use, and identify what constitutes a high user. Data were obtained from the DOD Ambulatory Data System as Standard Ambulatory Data Records. Data on Physical Evaluation Boards from the US Army Physical Disability Agency were added to the visit records. A total of 4,727,815 visits made by 647,017 patients were analyzed. Data were summarized by five views: 1) Overall, 2) Top 30 Primary Diagnoses visits, 3) Top 10% High Users, 4) High User Outliers (total visits exceeded 3 standard deviations above mean), and 5) Low Users (1-4 visits). In each view, three subsets of data were examined: Army-wide, by medical treatment facility (except for Top 30 Diagnoses), and Region 6.</p> <p>Five appendices present detailed summaries including total visits and age statistics, and frequency tables of visit and patient demographics and diagnoses and procedures. Mean number of AD visits Army-wide was 7.3 Overall compared to 54.1 for Outliers and 2.2 for Low Users. Noticeable differences between high and low users were identified. Data summaries indicate High User Outliers are likely to be patients: 1) with alcohol dependency/other mental disorder, 2) recovering from surgery/injury and requiring physical therapy/other rehabilitation, 3) female with normal pregnancies, or 4) with chronic back/lower leg joint pain. Logistic regression analyses found several factors significantly associated with being an Outlier including specific categories of gender, marital status, age group, patient beneficiary category, military rank, and number of physical therapy clinic visits.</p>

INTRODUCTION

In recent years, an increase in the number of soldiers utilizing ambulatory services in the US Army medical treatment facilities (MTFs) was noted, as well as the unexplained extremely high numbers of ambulatory visits by a low percentage of active duty personnel. Commanders wish to understand the significance of these excessive visits by identifying high users and trying to identify risk factors associated with that group of soldiers. Excessive visits to MTFs can have multiple implications for factors including 1) access to health care resources, 2) soldier wellness and morale, 3) commander control, and 4) communication between commanders and health care providers.

In May 2000, AMEDD Studies and Analysis Branch staff produced a summary of the top 100 active duty (AD) high users at selected Army ambulatory care facilities. The brief analysis was done at the request of personnel in the US Army Medical Command's Program Analysis and Evaluation Directorate. Data given to the Branch for analysis consisted of all ambulatory records on the top 100 AD users in 1999 at 21 selected Army MTFs. However, it was readily seen that the "top 100" was not a very feasible method of identifying high users. At several sites the top 100 included patients that had had as few as four visits. To actually identify and characterize high users, a more extensive analysis was needed. Staff with AMEDD Studies and Analysis Branch believed that knowledge concerning the whole range of AD users, or patients, was necessary in order to define "high user." Examining data on all AD ambulatory care users would provide the basis for determining what constitutes a high user and enable the possible identification of factors that might characterize such a user.

The purpose of the current study was to provide military commanders with a profile of the most frequent AD users of the Army's ambulatory services. To accomplish this, all calendar year 1999 AD use of the Army's ambulatory treatment facilities was examined, various levels of use were characterized, and a definition of high users was developed.

DATA AND METHODS

All medical care facilities in the US military are grouped administratively under "parent" MTFs. Each parent MTF has one or more "children" or subordinate MTFs. Sometimes a parent MTF has only one subordinate MTF—itself. Each ambulatory care encounter, or visit, at a military medical care facility generates data which is initially stored electronically in the Department of Defense Ambulatory Data System (ADS) used by the MTFs. Information on each ambulatory visit is routinely downloaded from the ADS in the form of a Standard Ambulatory Data Record (SADR) and sent by the parent MTFs to an electronic repository at Fort Detrick, Maryland. One patient visit is represented by one SADR.

Data for this study were extracted from the SADR repository at Fort Detrick by staff at the US Army Patient Administration and Biostatistic Activity (PASBA). All calendar year 1999 visits under Army parent MTFs where the patient was a military person on AD were extracted.

PASBA provided the records to AMEDD Studies and Analysis Branch in 36 ASCII text files, one for each of the Army's 36 parent MTFs. AMEDD Studies and Analysis Branch staff used SAS software to read in and convert the 36 raw files into a single SAS dataset consisting of 4,727,874 records and 71 variables.

Several preliminary analyses were run on this initial dataset. Records were checked to ensure that only visits of AD sponsors were included by verifying that the patient was both AD (third character of beneficiary category variable was "1") and a sponsor (family member prefix was "20"). Also, only records with non-missing sponsor Social Security numbers (SSNs) and with identical sponsor and patient SSNs were retained. Fifty-nine records failed to meet the preceding criteria and were eliminated. Remaining in the study were 4,727,815 ambulatory visits (observations) made by 647,017 patients (unique sponsor SSNs).

Initial frequency tables were produced for all variables. Eleven SADR variables were missing or zero-filled on every record and were dropped from the study dataset. A variable giving the year and month of the visit was constructed from the appointment date. The 3-character, Army-wide MEPRS code for type of clinic was obtained as a substring of the 4-character MEPRS code included in the data. The total number of visits (total visits) of each patient was counted and then added to every record of the patient. In addition, for each patient the total number of visits within each MTF was computed.

The patient's date of birth (DOB) was reviewed preparatory to calculating patient age. It was found that 7,900 unique patient IDs (sponsor SSNs) had non-unique DOBs. The decision was made to use a patient's most frequently-occurring DOB to calculate patient age: $(\text{appointment date} - \text{patient's most frequent DOB}) \div 365.25 = \text{patient age}$.

A variable was added to indicate if a patient had had a physical evaluation board (PEB), regardless of reason, during 1999 or 2000. Data on PEBs was provided by the US Army Physical Disability Agency (USAPDA) as an Excel spreadsheet. The USAPDA data contained records on all cases that reached a PEB between January 1, 1999 and December 4, 2000. The study data and the PEB data were merged by sponsor SSN, with a flag (PEB variable) set to yes on all of a patient's visit records if a match was found in the PEB data.

Besides setting the PEB flag to "yes," a match also caused the patient's calculated age to be replaced by the patient age from the PEB record (if PEB age was between 17 and 75, inclusive). The reason for substituting patient age from the PEB records was twofold. First, prior to merging with the PEB data, a frequency table of patient age revealed problems: calculated ages ranged from "-12" to "100," with more than 1,000 patients being younger than age 17 or older than age 75. The obvious erroneous ages plus the previously noted variation in many patients' birthdates produced a lack of confidence in the DOB variable originating in the ADS system. Second, it was felt that patient information in the PEB records was probably more accurate given the purpose of the PEBs and the reviews that precede a case being received by a PEB.

After merging with the PEB data, patient age was reexamined and probable erroneous ages (younger than 17 and older than 75) were set to missing (1,577 patients). Then patient age groups and visit groups were created and added to the data records. Patient age was classified by

the age groups used for PT-Test requirements (17-21, 22-31, ..., 52-61, 62+). Two different group variables were used to classify visits per patient—one grouping is best at presenting the overall distribution of total visits (1-4, 5-8, 9-12, 13-16, 17+) while the other one presents a more detailed breakdown of higher visit counts (1-16, 17-20, 21-30, 31-40, 41-50, 51-75, 76-100, 101-150, 151+).

Throughout the study, three subsets of the ambulatory visit records were examined : Army-wide (visits combined for all 36 Army parent MTFs), By MTF (visits broken out for each parent MTF), and Region 6 (visits combined for four MTFs: Fort Polk, Fort Sill, Brooke AMC, and Fort Hood). Note that the total-visits-per-patient variable was recalculated for each MTF and for Region 6, based only on patients' visits within the given MTF or Region.

In order to reveal any unique characteristics associated with excessive ambulatory users, the available data were analyzed by five separate approaches or views. The five views defined in terms of visits are as follows:

- 1) Overall: All visits of all users.
- 2) Top 30 Primary Diagnoses: All visits where the primary diagnosis was among the 30 most-frequently-occurring primary diagnoses.
- 3) Top 10% High Users: All visits of users who had the top 10% highest number of visits.
- 4) High User Outliers: All visits of users whose total visits exceeded three standard deviations above the mean total visits per patient.
- 5) Low Users: All visits of users having only 1 to 4 total visits.

These five views were applied to each of the three subsets., resulting in 15 different summarizations of the ambulatory data. For example, analyses of Low Users were done for patients with only 1 to 4 visits Army-wide, for patients with only 1 to 4 visits within a parent MTF, and for patients with only 1 to 4 visits within Region 6. Thus, a specific individual user might be a Low User within one or more parent MTFs, but not be a Low User Army-wide or in Region 6. The same patient could have been a Low User in one MTF and a High-User Outlier at another MTF.

Each of these five views were examined in order to better identify, or characterize, what constitutes an “excessive user” of the ambulatory system. The Overall view captures the whole range of users and visits and provides the basis for logical identification of high users. The Top 30 Primary Diagnoses view examined use of ambulatory care based on heavy “resource consumption” by examining visit and patient characteristics associated with the most frequently used diagnoses. Both the Top 10% High Users and the High User Outliers views were two different approaches to identifying high users. The Top 10% view takes into account the differences in population size that occur among the parent MTFs. The Outliers view adjusts for the visit pattern within each group examined by identifying users who statistically far exceed the number of visits of an average user. Finally, the Low Users view provides a contrast that might further delineate high users. The definition of low user (1-4 visits) was determined by identifying what visit count was identified with approximately the lower half of the users (overall median number of visits was 4).

Several data summaries were produced for each of the fifteen combinations of views and subsets. Summary statistics were calculated for the continuous visit and age variables. Frequency tables were used to summarize visit and patient demographics as well as all diagnoses and procedures. Visit demographic variables refer to those directly related to the visit such as appointment month, type of clinic, and provider specialty—and would be expected to vary from visit to visit. Patient demographic variables relate to the patient, such as patient age, gender, and marital status; and, although independent from the visit, these patient characteristics can also vary with time. For example, between one visit and the next, a patient can get married or divorced, be promoted, or have a birthday. Thus, the values of patient variables can vary depending on which visit record is examined. In this study, patient demographic summaries for any group of visits were always based on each patient's first visit within the given group of records. Analyses of variance (ANOVAs) across all sites and across Region 6 were done for total visits by MTF. Logistic regression analyses were used to assess the risk of being a High User Outlier as a function of selected patient and visit demographic variables. The Hosmer-Lemeshow statistic was used to evaluate the fit of the logistic regression equations. All data analyses throughout the study were run using Base SAS[®] or SAS/STAT[®] software.

RESULTS AND DISCUSSION

After data cleaning was completed, the calendar year 1999 study data consisted of approximately 4.7 million ambulatory visits by about 647,000 active duty personnel. Less than 60 records were eliminated during data checks and cleanup, so this report basically summarizes the population of AD visits in 1999, not just a sample.

APPENDIX TABLES

Detailed summaries of the ambulatory data for each perspective are presented in five appendices. Appendix 1, Overall Summary, is included at the end of this report. Appendix 2, Top 10% High Users Summary, and Appendix 3, High User Outliers Summary, are included in a second volume (RP 01-00XA). Appendix 4, Top-30 Primary Diagnoses Summary, and Appendix 5, Low Users Summary, are included in a third volume (RP 01-00XB). In each appendix, data are summarized by subset (Army-wide, By MTF, and Region 6), and within a subset, data are presented in two sets of tables: "Visit and Patient Profiles" and "Diagnoses and Procedures."

Each Profiles section consists of 4 tables: a) total visits per patient summary statistics, b) patient age summary statistics, c) frequency distributions of visit demographic variables, and d) frequency distributions of patient demographic variables. Summary statistics for total visits per patient and for patient age are based on non-missing values. Visit demographic variables include: parent MTF (only in Army-wide and Region 6 views), appointment month, type of clinic (based on MEPRS 3-character code), name of clinic providing the care, provider specialty, appointment status type, disposition code, first administrative disposition code, ambulatory surgery visit, inpatient visit, and state where the clinic providing care is located. Note that the frequency distribution tables do not include "0" counts in the frequency column. For instance, if there were no visits to an optometry clinic in a given view and subset combination, then "BHC

Optometry Clinic" would be omitted from the frequency distribution table for type of clinic. Also note that the percentages shown are based on the total number of visits with non-missing values (total number of non-missing equals the last value in the cumulative frequency column). The number of records with missing values are shown immediately following the distribution. If no "frequency missing" is shown then the final cumulative frequency equals the total number of visits in that combination of view and subset. Patient demographic variables include the following: total visits per patient, age group, gender, marital status, patient beneficiary category, military rank, PEB, alternative care value (denotes eligibility/enrollment status in the military health care system), and medical insurance, (and patient race and ethnic group, only in Overall views). Note that for each patient demographic variable, the final cumulative frequency plus the frequency missing (if any), equals the total number of patients in the specified perspective and subset combination. Also note that the presentation of total-visits-per-patient distributions vary: in the Overall views, both methods of grouping total visits are included; in the high user views (Top 10% and Outliers), the visit group with more breakdown in higher counts is used; in the Top 30 Diagnoses views, both methods of grouping are shown; and in the Low User views, actual visit counts (not groups) are used.

The Diagnoses and Procedures tables summarize ICD9 and CPT4 codes found in the specified group of visits. Three sections of tables are included for all views: primary diagnosis, non-primary diagnoses, and procedures. Each section begins with a listing of the top codes (90 for Army-wide and Region 6, 45 for each MTF), followed by a summary of all codes grouped into classes. However, for the Top 30 Diagnoses analysis, only frequency tables of the top 30 codes (primary ICD9, non-primary ICD9, CPT4) are presented (plus the Visit and Patient Profiles). Code groups were created by taking the first three characters of individual codes and using the hierarchical structure of the ICD9 and CPT4 coding manuals to define the groups. Primary and non-primary diagnoses were grouped using 19 possible categories (Table 1), while procedures were placed into 41 possible categories (Table 2).

GENERAL SUMMARY AND HIGHLIGHTS

Patient and Visit Summary Statistics. Table 3 shows the total numbers of patients and visits Army-wide for each of the five perspectives. Patients in the Top 10% High Users view represented approximately 10% of all users, but accounted for about 42% of all visits. [Note : the Top 10% includes more than 10% of the patients (10.4%), because this group was based on the 90th percentile value for total visits per patient—several patients above the 90th percentile patient had the same number of visits and were thus included in the Top 10% view.] High User Outliers made up about 2% of all users, but accounted for 14.5% of all AD ambulatory visits. About 81% of all patients and 42% of all visits involved Top-30 Primary Diagnoses. Low Users, with only 1-4 visits for the year, accounted for 53% of all AD users, but were responsible for only about 16% of all visits.

Table 3. Army-wide AD patient and visit counts.

	Patients	Visits
Overall	647,017	4,727,815
Top 10% High Users	67,306	1,963,168
High User Outliers	12,696	687,030
Top-30 Diagnoses	524,453	2,002,634
Low Users	343,590	741,722

Table 4 presents a summary of total visits per AD patient for the five perspectives in the Army-wide and Region 6 subsets. Region 6 treated approximately 1/6th of the AD patients which were seen at all Army sites in 1999. The average number of visits per patient and the variation among individual patients was very similar between the two subsets within a given perspective. Number of patients as well as mean number of visits per patient indicate that the Top-30 Diagnoses perspective did not identify high users. Rather, this view captured both low and high users, and included over 80% of the total AD ambulatory patients in both subsets. Patient counts show that for both Army-wide and Region 6, High User Outliers represented approximately 2% of the total AD patients, and the group's minimum number of visits was almost twice that found for the Top 10% view.

Table 4. Statistics on total visits per AD patient for Army-wide and Region 6.

	Mean	SD	Min	Max	Median	Mode	N

A summary of total visits per AD patient by parent MTF is presented in Table 5. Analysis of variance done on each perspective found that mean visits per patient differed significantly by MTF ($p < 0.0001$ for all five analyses). Mean number of Overall visits ranged from 3.6 at the 121 General Hospital Seoul to 7.7 at William Beaumont AMC. Mean number of High User Outlier visits ranged from 23.6 at 121 General Hospital Seoul to 85.6 visits at Walter Reed AMC. As was found Army-wide and in Region 6, High User Outlier patients represented approximately 2% of all AD patients within each MTF. The maximum number of visits per patient varied from less than 60 (58 at Fort McClellan and 52 at Camp Zama MEDDAC) to more than 300 (356 at Walter Reed AMC and 415 at Brooke AMC).

Table 6 presents summary statistics on patient age for the five study perspectives for both Army-wide and Region 6 subsets. Mean patient age in the 10 groups was very similar, only ranging from 27.2 to 29.3 years. Amount of variation also showed little difference, with standard deviations of 7.7 to 8.7. Minimum age in all 10 groups was 17 years. Outliers had the youngest maximum age in both the Army-wide (66 yrs) and Region 6 (59 yrs) subsets. Army-wide, the most frequently occurring age in the High User Outliers was age 25 compared to 20 and 21 for the other four perspectives. However, in Region 6, Outliers, together with Top 10% High Users and Top-30 Primary Diagnosis Users had the youngest age mode (21 yrs); Overall and Low Users had the oldest age mode (24 yrs).

Patient age showed more variability when analysis was performed at the parent MTF level (Table 7). Mean age Overall varied from lows of 23.5 and 23.6 years at Forts Leonard Wood and Jackson, respectively, to highs of 35.3 and 36.5 years at Fort Belvoir and Walter Reed AMC. Comparing mean age among the five perspectives within the individual parent MTFs found that in 17 of the MTFs, High User Outliers had the highest mean age, but in 11 other MTFs, Outliers had the lowest mean age. In 19 MTFs, Low Users had the oldest mean age.

Visit Demographics. The number of AD ambulatory visits varied widely Army-wide among the parent MTFs, with Camp Zama MEDDAC having less than 7,500 visits overall in 1999 to Forts Hood and Bragg each receiving more than 330,000 visits. The other MTFs experienced between 21,000 and 224,000 visits overall during the calendar year. AD visits were distributed fairly uniformly throughout 1999, with about 5.5-6.6% of the visits occurring in the slowest visit month and about 9.6 to 10.2% occurring in the heaviest visit month. Overall, Top 10% High Users, High User Outliers, and Top 30 Diagnoses visits all numbered the lowest in December and the highest in March. However, Low Users visits were lowest in May and highest in June.

There were noticeable differences among the five perspectives in the type of clinic most often visited (Table 8). For High User Outliers, Top 10% High Users, Top 30 Primary Diagnoses Users, and Overall Users, the three most visited clinics were Physical Therapy, Primary Care and Family Practice. For the High User Outliers and Top 10% patients, Physical Therapy clinics received the most visits, followed by Primary Care and Family Practice. However, for Overall and Top30 Diagnoses patients, Primary Care clinics had the most visits, followed by either Family Practice or Physical Therapy. Also, Low Users visited Primary Care clinics the most often, but then Optometry clinics and Family Practice clinics; Physical Therapy clinics received only 1.5% of their visits.

Table 8. Top three types of clinics most visited in each perspective Army-wide and % of total visits in given perspective.

	1st Clinic	%	2nd Clinic	%	3rd Clinic	%
Overall	Primary Care	23.6	Phys Therapy	11.1	Family Prac	9.8
Top 10% High Users	Phys Therapy	19.7	Primary Care	15.0	Family Prac	9.0
High User Outliers	Phys Therapy	26.2	Primary Care	8.7	Family Prac	6.4
Top 30 Diagnoses	Primary Care	28.2	Family Prac	10.7	Phys Therapy	10.0
Low Users	Primary Care	31.1	Optometry Cl	10.4	Family Prac	8.5

Table 9 contrasts the top provider specialties seen most often Army-wide by AD patients in each perspective. Physician Assistants were the providers most often seen by patients in the Overall, Top-30 Diagnoses, and Low Users views, followed by Unknown specialty and General Practice Physician. In contrast, Top 10% patients were seen most often by Unknown specialty followed by Physician Assistants and Physical Therapists, while Outliers were seen most often by Physical Therapists, followed by Unknown specialty and Physician Assistants. The provider specialty of Physical Therapist appears to correspond with the number of visits the two high use groups had with Physical Therapy clinics.

Table 9. Top three types of provider specialties Army-wide for each perspective and % of total visits in given perspective.

	1st Specialty	%	2nd Specialty	%	3rd Specialty	%
Overall	Physician As	18.3	Unknown	15.0	General Pract	10.0
Top 10% High Users	Unknown	15.4	Physician As	12.5	Physical Ther	12.1
High User Outliers	Physical Ther	16.0	Unknown	15.7	Physician As	8.2
Top 30 Diagnoses	Physician As	21.9	Unknown	16.5	General Pract	11.5
Low Users	Physician As	24.1	Unknown	15.4	General Pract	11.6

Except for Low Users, appointment status type, referring to how appointments were initiated, had the same order of frequency in all perspectives Army-wide (Table 10). Visits were most often by scheduled appointment, second, by Walk-in, third, by Sick-call, and last, by Telephone Consult. However, for High User Outliers and Top 10% High Users, more than 50% of all visits were by scheduled appointments and about 30% were walk-in; Sick-calls were less than 10%. For the other three perspectives, scheduled appointments and Walk-ins were more equally distributed, both ranging between 32% and 47%, and Sick-calls had a higher occurrence, between 14% and 18%. In contrast to the other groups, Low Users actually had more visits that were Walk-ins than were scheduled appointments.

Table 10. Army-wide distribution of appointment status type.

	Sched Appt	Walk-in	Sick-call	Tele. Consult
Overall	45.4%	35.7%	14.3%	4.5%
Top 10% High Users	54.6%	29.8%	9.8%	5.8%
High User Outliers	58.5%	29.0%	6.5%	6.1%
Top 30 Diagnoses	41.3%	38.6%	16.1%	4.1%
Low Users	32.8%	47.1%	17.8%	2.4%

Visit dispositions (disposition code) were primarily of two kinds for all users Army-wide: "released without limit" and "released with work limitations" (Table 11). Low Users were

released without limit from more than 80% of visits and with work limitations about 15%. High users, both Outliers and Top 10%, were released without limit from only about 60% of their visits and with limitations about 35%.

Table 11. Army-wide distribution of top three disposition codes.

	Released w/o lmt	Rels w/ wrk lmt	Sick at home/qtrs
Overall	70.8%	25.1%	2.9%
Top 10% High Users	64.0%	32.0%	2.7%
High User Outliers	61.2%	35.5%	2.2%
Top 30 Diagnoses	73.3%	22.7%	3.2%
Low Users	81.5%	14.7%	2.6%

Table 12 summarizes the Army-wide distribution of Administrative Disposition Code 1. Note that these percentages are based on only 3% of the visits at best; for Low Users, less than 1% of visits had non-missing data for this variable). The most noticeable difference is that Low Users visits had about 10% fewer consults requested and about 10% more times were referred to another provider.

Table 12. Army-wide distribution of Administrative Disposition Code 1.

	Consult Requested	Refer to another prov	Convalescent leave	Medical Board	Medical Hold
Overall	46.4%	46.5%	1.6%	5.0%	0.5%
Top 10% High Users	48.7%	42.8%	2.5%	5.5%	0.6%
High User Outliers	45.9%	42.2%	2.9%	7.5%	1.5%
Top 30 Diagnoses	47.3%	46.2%	0.9%	5.4%	0.2%
Low Users	38.5%	56.1%	0.5%	4.3%	0.7%

The percentages of Army-wide AD visits that were ambulatory surgery or inpatient appointments are shown in Table 13. The high visit Outliers and Top 10% groups have at least three times more of both types of appointments compared to the Low User group. (Note: most visits had missing values for these two variables. Both variables were coded in the data to indicate "yes" if true and left blank if "no." So the missing values could include both missed information as well as "no" answers.)

Table 13. Percentage of Army-wide visits that were ambulatory surgery or inpatient appointments.

	Ambulatory Surgery Appt	Inpatient Appointment
Overall	0.6%	0.7%
Top 10% High Users	0.7%	1.3%
High User Outliers	0.7%	2.2%
Top 30 Diagnoses	0.2%	0.3%
Low Users	0.4%	0.1%

Patient Demographics. A summary of total visits per patient for each of the study perspectives is presented in Table 14. The distribution Overall shows that a little more than 50% of all patients had less than 5 visits for the entire year and approximately 75% had less than

9 visits. Nearly 70% of the Top 30 Diagnoses perspective had less than nine visits. Army-wide, both high-user groups had no patients with fewer than 17 visits.

Table 14. Army-wide distributions of total visits per patient.

	Total Visits per Patient				
	1-4	5-8	9-12	13-16	17+
Overall	53.1%	21.0%	10.0%	5.5%	10.4%
Top 10% High Users	0.0%	0.0%	0.0%	0.0%	100.0%
High User Outliers	0.0%	0.0%	0.0%	0.0%	100.0%
Top 30 Diagnoses	45.2%	23.9%	11.8%	6.5%	12.6%
Low Users	100.0%	0.0%	0.0%	0.0%	0.0%

Table 15 also summarizes Army-wide visit distributions, but uses the second grouping method which details high visit counts. It is easy to see that the Top 30 Diagnoses view included both high and low users and that it has a visit distribution similar to that of the Overall view. Note that for Army-wide data, the High User Outliers view includes no patients with fewer than 31 visits.

Table 15. Percent distribution of total visits Army-wide (with detailed breakdown of 17+ visits).

	Total Visits per Patient								
	1-16	17-20	21-30	31-40	41-50	51-75	76-100	101-150	151+
Overall	89.6%	3.3%	4.1%	1.6%	0.7%	0.6%	0.1%	0.1%	0.0%
Top 10% High Users	0.0%	31.3%	39.1%	15.3%	6.7%	5.5%	1.3%	0.6%	0.1%
High User Outliers	0.0%	0.0%	0.0%	24.3%	35.4%	29.4%	6.9%	3.3%	0.7%
Top 30 Diagnoses	87.4%	3.9%	4.9%	1.9%	0.8%	0.7%	0.2%	0.1%	0.0%
Low Users	100.0%	0.0%	0.0%	0.0%	0.0%	0.0%	0.0%	0.0%	0.0%

Army-wide, there does not appear to have been much difference in the age distribution of patients in the five study perspectives (Table 16). One noticeable fact is that Army-wide, the Low Users are the only group where patients age 62 or older represented at least 1% of the ambulatory users. Another fact shown is that the largest age group in every perspective was the "22-31" year olds, ranging from 39.0% of the Low Users to 45.4% of the High User Outliers.

Table 16. Percent distribution of patient age in the Army-wide perspective.

	Patient Age (Yrs)					
	17-21	22-31	32-41	42-51	52-61	62+
Overall	27.8%	40.6%	23.5%	7.0%	1.0%	0.0%
Top 10% High Users	24.3%	44.1%	23.5%	7.2%	0.9%	0.0%
High User Outliers	20.4%	45.4%	25.4%	7.8%	1.0%	0.0%
Top 30 Diagnoses	28.9%	41.5%	22.3%	6.4%	0.9%	0.0%
Low Users	28.9%	39.0%	23.7%	7.2%	1.2%	0.1%

The Army-wide distribution of patient gender is summarized in Table 17. Both Outliers and Top-10% groups include about 40% female patients compared to the other three views which have between 12 and 19 % female patients.

Table 17. Army-wide percent distribution of patient gender.

	Female	Male	Unknown
Overall	18.1%	81.8%	0.1%
Top 10% High Users	38.4%	61.5%	0.0%
High User Outliers	42.2%	57.8%	0.0%
Top 30 Diagnoses	19.1%	80.9%	0.0%
Low Users	12.5%	87.4%	0.1%

There were no large differences in marital status among the five study perspectives Army-wide. Ninety to ninety-two percent of patients in each perspective were either married or single (never married). However, Low User Outliers had the highest percentage of married patients and the lowest percentages of singles and of those divorced or legally separated, while High User Outliers had the lowest percentage of married patients and the highest percentage of those divorced or legally separated.

Table 18. Army-wide distribution of patient marital status.

	Married	Sgl, Never Married	Divorced or Leg Separate
Overall	59.8%	31.1%	3.7%
Top 10% High Users	59.1%	32.6%	4.8%
High User Outliers	59.0%	32.3%	5.7%
Top 30 Diagnoses	59.2%	32.5%	3.7%
Low Users	60.1%	29.6%	3.3%

Table 19 shows the percentage of patients that had a case reach a PEB between January 1, 1999 and December 4, 2000 and the percentage of patients that had medical insurance. High User Outliers and Top 10% High Users had much higher percentages of patients with PEB cases than any of the other perspectives. Top 10% users had 15 times more cases than Low Users, and Outliers had approximately 27 times more cases than Low Users. The percent of patients having medical insurance showed little variation among the study groups.

Table 19. Percentage of AD ambulatory patients Army-wide with PEB cases or medical insurance.

	PEB	Medical Insurance
Overall	2.3%	0.2%
Top 10% High Users	10.5%	0.2%
High User Outliers	19.1%	0.2%
Top 30 Diagnoses	2.6%	0.1%
Low Users	0.7%	0.2%

Examination of patient beneficiary categories and alternative care values showed that a higher percentage of the Outliers and Top 10% groups were extended AD personnel with "Active Duty/MCP" alternative care value. Low Users had the highest percentage of Reserve and National Guard personnel. Army-wide, 83% to 89% of all AD ambulatory users were enlisted personnel (Table 20), with the highest percentage in the two high user groups, each with 89%. Officers accounted for 8% to 15%, being highest in the Low User group and lowest in the High User Outlier group. Warrant Officers represented 2% of the patients in each study

perspective. Table 20 shows that E4s accounted for the highest percentage of users in both the High User Outlier (24%) and Top 10% High User (22%) groups, while E1s were highest in Low Users, Top 30 Diagnoses, and Overall perspectives. E1s and E4s together accounted for more than one-third of all patients in all but the High User Outlier group, where E1s were not in the top three ranks in terms of ambulatory use (E1s ranked 5th with 10.3%).

Table 20. Army-wide distribution of patient rank.

	Enlisted	Officer	Warrant Officer
Overall	84%	13%	2%
Top 10% High Users	89%	9%	2%
High User Outliers	89%	8%	2%
Top 30 Diagnoses	84%	12%	2%
Low Users	83%	15%	2%

Table 21. Top three ranks Army-wide in use of ambulatory clinics and their percentage in study perspective.

	1st Rank	2nd Rank	3rd Rank
Overall	E1 19%	E4 17%	E5 13%
Top 10% High Users	E4 22%	E1 13%	E3 13%
High User Outliers	E4 24%	E3 14%	E5 13%
Top 30 Diagnoses	E1 20%	E4 17%	E5 12%
Low Users	E1 21%	E4 15%	E5 13%

The distributions of patient race and ethnicity are shown only in the Army-wide Profiles section of the Overall appendix (App 1). The variables were omitted in all other summaries because of the high percentage of missing data for these two variables—78% of patient race and 80% of ethnic group values were coded as “Unknown.” An additional 5% were missing for both factors.

Diagnoses and Procedures. Frequency distributions of the diagnoses and procedures from the ambulatory visits were studied to determine if differences could be identified between those of high and low users. Table 22 shows in bold print all primary diagnoses which occurred in at least 2% of all High User Outlier visits Army-wide. Also, some of the top primary diagnoses which occurred in visits of Top 10% High Users and Low Users are presented. The first, third and fourth most common primary diagnoses of the Outliers (30390 Alcohol Depend; V571 Rehab, Oth Phys Therapy; and V221 Supervision of Other Normal Pregnancy) occurred in less than 1% of all Low User visits. In addition, 30390 and V221 occurred as non-primary diagnoses in less than 1% of all Low User visits. Similar to their occurrence in Outlier visits, these three diagnoses ranked among the top eight codes in Top 10% High Users visits, having at least a 1% occurrence. The other three most common Outlier primary diagnoses (7242 Lumbago, 71946 Pain in Joint Involving Lower Leg, and V6549 Other Specified Counseling) were also found among the most common primary diagnoses for Low Users, as well as for Top 30 Diagnoses and Overall patients. Besides being a top-occurring primary diagnosis, V571 Rehab was also the most common non-primary diagnosis of Outlier, Top 10%, and Overall visits.

Table 22. Most frequently occurring primary diagnoses of High User Outliers Army-wide, compared with those of Top 10% High Users and Low Users.

	Rank	Primary ICD9 Diagnosis	Frequency	%
High User Outliers	1	30390 Alcohol Depend,Oth,Unsp,Unsp Use	23,664	3.4
	2	7242 Lumbago	1,591	3.1
	3	V571 Rehab, Oth Phys Therapy	18,020	2.6
	4	V221 Supervisn, Oth Normal Pregnancy	17,109	2.5
	5	71946 Pain in Joint Involvg Lower Leg	16,900	2.5
	6	V6549 Oth Specified Counseling	14,544	2.1
Top 10% High Users	1	7242 Lumbago	66,671	3.4
	2	71946 Pain in Joint Involvg Lower Leg	48,441	2.5
	3	V221 Supervisn, Oth Normal Pregnancy	42,902	2.2

	14			
	15	71946 Pain in Joint Involvg Lower Leg	9,444	1.3

Identifiable differences between high and low users were observed after all primary diagnoses found in the data for a given study perspective and subset were summarized into groups. Table 23 presents the primary and non-primary diagnosis groups that accounted for 5% or more of the diagnoses in the Army-wide high and low user groups. The highest occurring primary diagnosis groups for High User Outliers are shown in bold print. Supplementary V classification codes, which indicate factors that influence health status and contacts with health services, had the highest occurrence in each group, accounting for approximately one-third of all primary diagnoses in both the High User Outliers and the Top 10% High Users and nearly one-half in the Low Users. V codes also included almost half of all non-primary diagnoses for the both high user groups and nearly 60% of those for the Low Users. A major difference found in the grouped diagnoses was that Mental Disorders which accounted for 13.2 % of primary diagnoses and 5% of non-primary diagnoses in the Outlier perspective, and for 9% of primary diagnoses in the Top 10% High Users, included less than 5% of diagnoses in the Low Users. Also, Injury and Poisoning, which accounted for 11%-12% of diagnoses in the High User Outliers and 9% of primary diagnoses in the Top 10% group, accounted for less than 8% of the Low Users.

Table 23. Most frequently occurring diagnosis groups from High User Outliers Army-wide, compared with those of Top 10% High Users and Low Users.

	Rank	ICD9 Diagnoses	Frequency	%
High User Outliers				
Primary Diagnoses	1	V01-V82 Factors Influen Hlth Stat/Cntct	228,414	33.3

	2	320-389 Dis, Nervous Sys/Sense Organs	20,752	14.2
	3	710-739 Dis,Mus-Skel Sys/Connectiv Tis	9,029	6.2
	4	460-519 Diseases of Respiratory System	8,192	5.6

When frequency distributions of Region 6 diagnoses codes were examined, results did not match those found Army-wide. In Region 6, the top-ranking primary diagnosis code for Outliers and Top 10% High Users was 71946 Pain in Joint Involving Lower Leg. This code was ninth for the Low Users, which had V721 Examination of Ears and Hearing as the most common primary diagnosis. So in Region 6, differences were still seen between the high and low users, but different primary diagnoses were involved or were ranked at different levels.

In a comparison of CPT4 procedure codes from AD ambulatory visits Army-wide, it was found that 97110 Therapeutic Exercises was the most common procedure performed for High User Outliers, Top 10% High Users, and Overall patients. However, the amount of its occurrence varied by study perspective. Table 24 shows the top seven procedure codes in each of the three study perspectives. Codes which were most frequent for High Users are printed in bold. The 97110 Therapeutic Exercises procedure accounted for 19.0% of all Outlier procedures and 14.9% of all Top 10% High Users procedures. Overall, it dropped to 9.3% of all procedures

Army-wide, and accounted for only 1.1% of all procedures for Low Users (ranked 21st). The second most common procedure for High User Outliers was 97010 Hot or Cold Packs Therapy (10.1%) and it also ranked second for Top 10% High Users (8.2%) and for Overall users (4.9%); it had less than 1.0% occurrence in Low User visits. Four other procedures (97530 Therapeutic Activities, 90853 Special Group Therapy, 99078 Group Health Education, and 97035 Ultrasound Therapy) each accounted for more than 2.5% of all Outlier and Top 10% procedures. Each of the first three of these codes also represented at least 2% of procedures Overall. However, only one, 99078 Group Health Education, had more than a 1% occurrence in Low User visits and was, in fact, the most common Low User procedure (7.4%).

Table 24. Most frequently occurring procedures of High User Outliers Army-wide, compared with those of Top 10% High Users and Low Users.

	Rank	CPT4 Procedure	Frequency	%
High User Outliers	2	97110 Therapeutic Exercises	129,403	19.0
	3	97010 Hot Or Cold Packs Therapy	68,835	10.1
	4	97530 Therapeutic Activities	30,178	4.4
	5	90853 Special Group Therapy	27,117	4.0
	6	99078 Group Health Education	23,865	3.5
	7	97035 Ultrasound Therapy	19,319	2.8
Top 10% High Users	2	97110 Therapeutic Exercises	251,439	14.9
	3	97010 Hot Or Cold Packs Therapy	137,358	8.2
	4	99078 Group Health Education	62,726	3.7
	5	90853 Special Group Therapy	58,997	3.5

	7	99071 Patient Education Materials	18,678	3.7

HIGH USER RISK FACTORS

Table 25 summarizes the results of assessing the risk of being a High User Outlier based on individual demographic variables. The reference in each logistic regression model, given in parentheses, is the basis or reference value for the odds ratio. The odds ratio captures the relationship (association) between the probability of being a High User Outlier and one or more of the examined risk factors. Included in the table are the 95% confidence intervals (CIs) for the odds ratios. When the 95% CI for an odds ratio does not contain 1, it indicates that the given demographic variable is significant in explaining the risk of being a High User Outlier.

The model assessing risk based on gender found that a female patient was 3.4 times more likely than a male to be a High User Outlier. The marital status model with “married” as the reference value, found all other patients had more risk of being a high user: singles were 2.6,

divorced patients were 3.9, and widowed patients were 5.3 times more likely to be a High User. Compared to patients with the "AD/MCP" alternative care value, those without it were 2.4 times more likely to be a High User. (Alternative care value denotes the eligibility/enrollment status in the military health care system. In the study data, 60% of extended AD and 61% of all AD users had the alternative care value of AD/MCP (Managed Care Program).) The logistic regression model based on patient beneficiary category shows that extended AD patients had the highest risk of being a High User Outlier. Recruits had the lowest risk (odds ratio=0.137, CI: 0.097-0.193), AD reservists and members of the National Guard were respectively 21% and 20% as likely as extended AD to be High User Outliers. The assessment of age as a risk factor showed that patients 62 years and older had the least risk of being High User Outliers, with only about 78% of the risk of patients aged 17 to 21 years. Patients belonging to any of the other age groups were 1.4 to 1.5 times more likely to become a High User Outlier.

Compared to enlisted ranks E1 to E3, results showed that based on rank, the only patients who had a significantly greater risk of being High Users were other enlisted personnel. E4s and E5s were respectively 1.5 and 1.3 times more likely to become High User Outliers. AD patients who were officers had only 41% to 78% of the chance of being High Users compared to the reference group. Since physical therapy clinics, physical therapists, and physical therapy procedures showed relatively high counts in the frequency summaries, a count variable was created for the number of visits per patient to a physical therapy clinic. Logistic regression showed that with each visit to a PT clinic, a patient's risk of being a High User Outlier increased by 124%.

The risk of being a High User Outlier was also assessed using a multiple logistic regression analysis. Results are presented in Table 26. Before running the multiple regression, the military rank groups were slightly modified. The cadet category, which was not significant in the military rank regression, was added to the "other" rank category. All independent variables were entered into the model simultaneously. The adjusted odds ratios from the multivariate analysis show several changes when compared to the odds ratios in Table 25. Risks based on patient gender, patient beneficiary category, and older age classes increased, while risks based on marital status, alternative care value, and military rank generally decreased. Based on analysis of individual variables, marital status categories of widowed and divorced, and gender category of female had the highest associated risks of being a high user (odds ratios of 5.3, 3.9, and 3.4, respectively). However, in the multivariate model, being a female had increased the risk of being a high user to 4.2 times the risk of that for a male; and was the factor with the highest adjusted odds ratio. Being widowed or divorced still meant a significant risk, but at lower levels than in the individual models (adjusted odds ratios of 2.9 and 2.4). The risk of being an outlier patient increased for someone with a patient beneficiary category of reserve, recruit, or National Guard, but still remained at less than 32% of the risk for someone who was extended AD.

Adjusted odds ratios for patient age categories showed some corrections compared to those in the individual age group model. In the simple regression analysis, a patient in the 22-31 yrs age group was about 1.5 times more likely to become a High User Outlier than someone in the 17-21 yr age group; but in the full model, after adjusting for covariates, that risk had dropped to 1.3. The risk of being a High User Outlier had increased for patients in the three oldest age groups, with the 52-61 yrs age group having the second highest risk of any factor in the full

model. The odds ratio for the age 62+ category changed from 0.8 in the individual model to 1.8 in the multiple model. In the individual military rank model, the enlisted groups E4 to E5 and E6 to E9 both had risks greater than the reference group (E1 to E3). In the full model, both enlisted groups had less risk than the E1 to E3 group (adjusted odds ratios of 0.8 and 0.6). A patient's number of PT clinic visits had almost identical risks under the individual and full models (1.238 odds ratio in individual model to 1.237 adjusted odds ratio in the full model).

Table 26. Adjusted odds ratios for being a High User Outlier based on full model of demographic variables.

CONCLUSIONS AND RECOMMENDATIONS

This study examined all 1999 visits to US Army ambulatory care facilities, with the goal of identifying characteristics of high and possibly excessive users of the system. Data were summarized from 4.7 million visits made by more than 647,000 patients. Five approaches or perspectives were analyzed as a means of better identifying what constituted a high user. The Overall and Low Users perspectives provided two different, but equally useful summaries of the ambulatory system. Low Users provided a good basis for comparison with "high" users. Low Users were defined after examination of all visits Army-wide showed that approximately one-half (53%) of all ambulatory patients had only 1 to 4 visits for the entire year. If high users can be distinguished from other patients based on information captured in the ambulatory data (by factors other than visit counts), then comparison with these 1-to-4-visit low users should reveal these differences.

Of the three attempts to identify high users, the Top-30 Primary Diagnoses perspective had the least usable results. This approach turned out to include both high and low users, as reflected in various summaries of visit and patient characteristics that were similar to results from the Overall summaries. The other two approaches to identifying high users, the Top 10% High Users and the High User Outliers perspectives, were both based on number of visits per patient and hence included only users with relatively high visit counts. Study results show that the High User Outliers, which have visit counts at least equal to three standard deviations above the Overall mean visit count, included approximately the top 2% of the AD users, compared to the broader-based Top 10% High Users. Differences in patient and visit characteristics of both Outliers and Top 10% High Users were found in comparisons with the Low Users. However, the differences were usually more pronounced between Outliers and Low Users, a logical result given that Outliers are the extreme opposite of Low Users in numbers of visits (mean visits Army-wide of 54.1 compared to 2.2). The Overall mean number of visits per AD ambulatory patient was 7.3 visits Army-wide, 6.7 visits in Region 6, and differed significantly by parent MTF, ranging from 3.6 to 7.7 visits. Patient age did not appear to be a factor distinguishing high and low users. Army-wide and in Region 6, Outlier mean age was only slightly older than that of Low Users, while it was sometimes older, sometimes younger, when summarized by MTF.

Noticeable differences between high and low users were identified in several visit and patient characteristics. Outliers and Top 10% patients visited more Physical Therapy clinics than any other kind, while Low Users visited more Primary Care clinics. High User Outliers saw Physical Therapists the most often while Low Users saw more Physician Assistants. For both high user groups, clinic visits were initiated by scheduled appointment more than 50% of the time, compared to only 33% of the time by Low Users. High User Outliers and Top 10% High Users were released without limitation in less than 65% of visits and with work limitation more than 30% of the time, compared to more than 80% without limitation and less than 15% for Low Users. High users had higher percentages of visits that were ambulatory surgery or inpatient appointments compared to Low Users. Both high user groups included three to four times the percentage of females found in the Low Users. The differences were not great, but High User Outliers had the highest percentage of singles, divorced, and separated patients and the lowest

percentage of married patients, while Low Users had the exact opposite, the least singles, divorced, and separated percentages and the highest married percentage. Overall, patients with a PEB case were more likely to be high users: 19.1% of High User Outliers and 10.5% of Top 10% High Users had a case reach the PEB during 1999 or 2000, compared to only 0.7% of Low Users. Both high user perspectives had nearly 90% enlisted patients compared to 83% of Low Users. Low Users had more officer patients, 15%, compared to less than 10% for the high user groups. Rank showed small differences by study perspective: more high users were E4s, more Low Users were E1s.

Differences were observed in the occurrence of diagnosis and procedure codes between high and low users. The three most common primary diagnosis codes for High User Outliers (30390 Alcohol Dependence, Other; V571 Rehabilitation, Other Physical Therapy; and V221 Supervision, Other Normal Pregnancy) were not among the top diagnoses for Low Users. Among the top six most common primary diagnoses of Outliers, only one was among the top 10 most common primary diagnoses of Low Users. In addition, the most common primary diagnoses of Outliers involved a specific health condition or problem. In contrast, the most common Low User primary diagnoses all involved routine health exams of various types. When all primary and non-primary diagnoses were summarized into diagnosis groups, differences were again seen between the high and low users. Mental Disorder diagnoses accounted for more than 5% of Outlier primary and non-primary diagnoses and Top 10% High User non-primary diagnoses, but occurred in less than 5% of Low User primary and non-primary diagnoses. The most common procedures for high users were primarily physical therapy procedures such as Therapeutic Exercises and "Hot or Cold Packs Therapy." Low Users most common procedures involved health education or procedures such as "Pure Tone Audiometry, Air" and measuring blood pressure.

Although many factors differed between high and low users, this study found no variable besides number of visits that could be used to readily distinguish high users from all others. No value of a patient or visit characteristic was identified as only occurring with high users. Patients having a PEB were more likely to be high users; however, many of these patients probably reached high-user status before their case reached the PEB. The data do indicate that high users are likely to be 1) patients with alcohol dependency or other mental disorder, 2) patients recovering from surgery or injury and requiring physical therapy or other type of rehabilitation, 3) female patients having normal pregnancies, or 4) patients with chronic back or lower leg joint pain.

One result of this study is to recommend the High User Outlier approach be used to identify "high users" rather than the Top 10% High User method. Differences between Outlier and Low User patients were stronger and more easily distinguished. Also, the Outlier patients represented the top 2% of the AD user population and accounted for 14.5% of all visits. In comparison, the Top 10% High Users represented approximately 10% of the patients, but accounted for more than 40% of all visits. In addition, when identifying high users at the MTF level (i.e., based on visits only within the given MTF), the Top 10% High Users approach can include patients with as little as 1 visit.

Another result from this study is the identification of several factors significantly associated with the risk of being a High User Outlier. Based on a multiple logistics regression model, it was

found that female patients were more likely than males to be high users. Single, divorced, widowed, and other marital status patients were more likely than married patients to be high users. Patients without the alternative care value of "AD/MCP" were more likely to be high users than those belonging to the AD/MCP category. Patients between the ages of 22 and 61, inclusive, were at greater risk of being high users than those aged 17 to 21. The number of PT clinic visits a patient had was positively associated with being an outlier user. Several factors were found which were negatively associated with being a high user. Patients who were reservists, recruits, or National Guard were less likely than extended AD patients to be High User Outliers. Patients of higher rank (based on group ranks) were less likely than those in the lowest enlisted ranks (E1 to E3) to be high users.

A possible use of results from this analysis would be to create a periodic 1-page report that could be generated along with other summaries currently being produced from the ADS or the SADR records. The short report could alert management to increasing trends in numbers of high users within a specified command area. It could also monitor for patients approaching a high-user threshold. If the High User Outlier method was used to identify high users, then patients approaching the high-use category could be identified as those with total visits exceeding two standard deviations above the mean. To enable generation of this monthly/quarterly/yearly report, certain steps would be necessary. A counter variable would need to be created and added to all patient records, which would increment when a new record is added to the system for a given patient. Or if that is not practical, the counter could be created temporarily at the time any summaries are being routinely produced. When a patient reached either the warning threshold or the high user category, flag variables would be set to indicate this fact. The flag variables could be part of the patient's record in the data system or could be created only at the times the reports are generated. The report could then present a short summary of the number of patients in the warning threshold and the high user categories for the most recent report period and compare the current figures with those from previous periods by means of a simple table or chart.

Initially, a high user could be defined using the Army-wide High User Outlier value obtained in the current 1999-based study: Overall mean visits + (3 x standard deviation in visits) = $7.3 + (3 \times 9.8) = 7.3 + 29.4 = 36.7 \rightarrow 37$ visits per year. The early warning value that a patient is approaching the high user category equals Overall mean visits + (2 x standard deviation in visits) = $7.3 + (2 \times 9.8) = 26.9 \rightarrow 27$ visits per year. If the reports were generated more than once a year, then high user visit category and warning category could be based on either the patient's visits for the past 12 months or a proportional number of visits for the given time span. For example, if the report were generated every 6 months, then the warning flag could be set if the patient had 14 or more visits during the 6 months just ending. The high user flag would be set if the patient had 19 or more visits during the most recent 6 months. Another option concerning the periodic report would be to run separate determinations of high users by parent MTF, using the Overall specific MTF mean and standard deviation.

Routine, periodic short reports on numbers of AD high users and threshold high users, with comparisons to those counts in previous periods, could provide management with a useful tracking tool. The report could alert management to unexpected increases or decreases in the percentage of high users, changes that could be occurring as an unexpected result of management or policy changes.
